

How is FlowStone installed?

FlowStone™, is like SuperStone, StoneCarpet and CrystalPave™ is a resin bound surface.

However, unlike the other finishes, FlowStone™ uses a specifically sized aggregate that results in a fantastically permeable product.

This allows water to make its way through the FlowStone™ layer and into the substrate beneath, making it an ideal solution for tree pits and the likes.

1. The specially formulated two component polyurethane resin is prepared and combined with the aggregate / glass then applied to the substrate.
2. The combined mix is then spread to ensure even coverage.
