The world is arguably less safe today than it has ever been. Threats from terrorism, political unrest and crime have increased the risk to the safety of personnel engaged in projects in potentially hostile environments worldwide. This is a major issue since most technicians, while highly specialized in their fields, seldom have the training to protect themselves in potentially dangerous situations.

Until now, the solution has been to contract with private security companies to ensure the safety of personnel engaged in projects where personal security may be an issue. However, private security firms are usually quite expensive and can be counterproductive to bringing in a project on-time and under budget. Taking a page from military history TacTech has solved this problem in a unique and cost-effective manner.

 TacTech’s Mission:
TacTech is dedicated to providing reliable and cost-effective services in situations where communications infrastructure has been disrupted by hostile action, or where technical expertise is required in situations where threats to life or property may exist.
Innovative Telecom Services for Remote and Hostile Locations

A Manpower Concept Based on a Rich Tradition

The TacTech concept is not new. In the early days of World War II, the US Navy was faced with the challenge of providing security for its construction crews tasked with building runways and facilities on remote islands during the “island hopping” campaign in the Pacific. Providing security meant tying up Marines who were sorely needed as “first wave” assault troops. The ingenious solution was the formation of specialized Construction Battalions (CBs) which were quickly named “Seabees”. Seabees are highly-trained technicians who have training in combat tactics. The result is a worker who can provide both craftsmanship and self-protection in virtually any hostile situation.

The TacTech Solution

TacTech has taken a page from military history and updated it to address the demanding requirements of the telecom industry in potentially hazardous situations. TacTech technicians are not only specialists in their fields, but are also well trained protective security personnel who have the capability of providing a high level of self-protection. Virtually all of TacTech’s field personnel are combat veterans. Many are former members of Special Forces units. TacTech teams provide on-site security while delivering on-time and under-budget job performance, at a cost which is significantly less than deploying both technical and security personnel to support a project.

Extensive Experience in Adverse Situations

Working in a hostile environment is not new to the TacTech team. For more than thirty-five years, the company’s management has been supporting the technical needs of clients around the world in potentially hostile locations. TacTech’s ‘hands-on’ telecommunications services include a wide variety of engineering, field service and project management solutions in wireless, fiber optics, satellite, cable, security electronics and broadcast technology. The company has managed projects in diverse locations throughout the world; some as hostile as the Anbar and Basra Provinces of Iraq, and as remote and dangerous as along the legendary Khyber Pass in Pakistan’s Khyber Pakhtunkhwa Province, (formerly the Northwest Frontier Province).
