

HYTRACKER® RAIL CART

When your project calls for undercutting, flood response or other excavator services in remote areas with no off-track access, Hulcher Services' Hytracker® rail cart provides the perfect solution.

The Hytracker® rail cart is a low-profile rear-loading platform that provides on-track access to excavators that aren't equipped with hi-rail gear. The rail cart is powered by the excavator's hydraulic system via a quick-coupling system; once connected, the cart and excavator become a self-propelled system that travels on track to reach even the most inaccessible places.

The cart is loaded onto the track by the excavator so no additional equipment is required. Likewise, the system can be separated and removed from the track in minutes, allowing the cart to work within the track's rail schedule.

The rail cart expands the excavator's reach to perform a wide range of services, including:

- Flood and natural disaster response
- Track panel installation
- Post-derailment response
- Undercutting
- Remediation
- Vegetation control
- Tunnel and bridge maintenance
- Pile driving (sheet pile, H-pile and rail)
- Many other maintenance-of-way services

As with all Hulcher equipment, the rail cart can be deployed within one hour of your call any time, day or night, and can be mobilized anywhere in the country.

Hulcher's Hytracker® rail cart expands the reach of the standard excavator to deliver mechanical, engineering, environmental and disaster response support where you need it, even in the most inaccessible places.
