

PANEL BOSS®

The Panel Boss® is an exciting system that revolutionizes the process of lifting, transporting and positioning rail track panel.

The traditional technique for laying track panels, which can be labor-intensive and slow, involves ground crews attaching the panels to chains that are suspended from an excavator. The Panel Boss® eliminates the need for the ground crew and chains. The excavator operator controls the Panel Boss® directly from the cab, placing it on the panel and activating its pins. With the device's pins in place, the excavator can lift the panel, rotate it to any angle, and place it exactly where it needs to go. This means track panels can be lifted and placed more quickly, precisely and safely than ever before.

Whether your project involves loading or unloading track panel, stacking panels around the rail yard or laying new track on the right-of-way, the innovative Panel Boss® delivers efficiency, safety and control that no other approach can match.
