TRACEABILITY

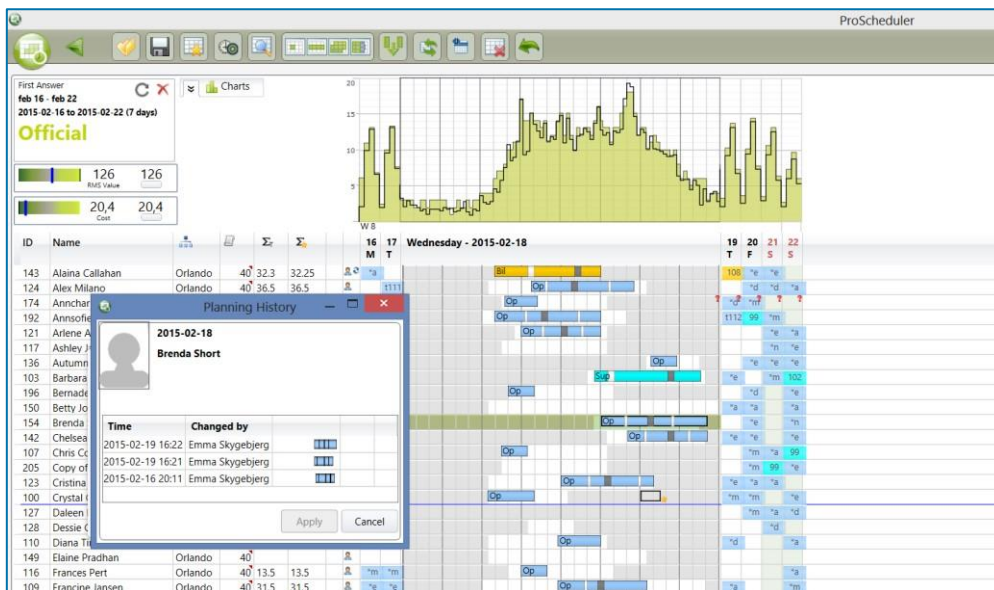

# Traceability

## Tracing schedule history

Traceability allows for changes in the schedule to be traced. It is a feature which is very useful when several schedulers make changes to a specific shift. The user can rewind changes and go back to a previous version of a schedule before the change has been made, selecting which version of the shift to save.

Traceability presents when the changes have been made, who made the change, and at what time and date the change has been made.

Traceability is a feature in ProScheduler WFM, a flexible and user-friendly solution, customized to meet your current and future requirements.

## Key benefits

- Traces shift versions
- Traces time, date and person who has made the change
- Possibility to select which version of the shift to be saved
- Multiple changes possible
- Great overview when several users make changes to the same shifts
