

# The DTE Energy New Homes Program recognizes

## Silverado Homes

for achieving the 2019 program's highest average electric savings per square foot

**Congratulations!** Please accept the **Top Electric Saver** award as a testament of your excellent performance in the DTE New Homes Program and your commitment to building high-efficiency HERS® rated homes in Michigan.

**DTE**

DTE Principal Supervisor, Residential Energy Waste Reduction

## Built for savings

DTE's New Homes Program offers rebates to encourage the construction of high-efficiency homes. Your participating homebuilder will use advanced construction methods to meet a higher standard of energy performance in newly built homes.

Each home is inspected and tested by a third-party Home Energy Rating System® (HERS®) rater who is trained in best practices for energy efficiency.

The result? A home built with exceptional design and materials that boost quality, comfort, and energy savings, which you can enjoy for years to come.

## Built-in benefits

DTE New Homes use less energy than homes built to minimum standards, which saves you energy costs each year, over the lifetime of your home. Energy-saving features are designed to increase comfort, reduce energy and maintenance costs, and maintain your home's value over time.

## DTE New Homes deliver:

- **Increased comfort** – These homes are built to minimize leaks and drafts that can cause hot and cold spots. Innovative techniques and high-efficiency equipment provide year-round, wall-to-wall comfort.
- **Healthier indoor spaces** – Tight construction reduces drafts, moisture, dust, pests, and pollen; it also contributes to healthier indoor air and a more comfortable home.
- **Retained value** – DTE New Homes are more durable and verified by a recognized third-party HERS® rater, which can boost resale value.

DTE Energy New Homes Program

# Built to a higher standard

# DTE

# How high-efficiency homes are built

Builders that participate in the DTE Energy New Homes Program focus on the following elements in the design and construction of participating homes.\*

- 1. Independent inspection and testing**  
Each participating home is inspected and tested by a third-party HERS® rater. A house built in Michigan with traditional materials and methods typically has a score between 72 and 80. The DTE Energy New Homes Program requires homes to score a 60 or less, resulting in more energy savings than a home built with traditional methods.
- 2. Airtight home construction**  
Tight construction reduces drafts, moisture, dust, pests, and pollen; it contributes to healthier indoor air and a more comfortable home.
- 3. Energy efficient lighting systems**  
High-efficiency lighting uses less energy and produces less waste heat. Lower waste heat reduces the demand on your air conditioner during the summer and saves you money year-round.
- 4. Energy efficient water heating system**  
Efficient water heating systems save energy while providing equivalent or improved supply capacity, which will keep you from running out of hot water.
- 5. Energy efficient heating and cooling equipment**  
Properly sized systems require less maintenance and last longer. This is especially important for your air conditioner, because a properly sized system works much more efficiently and helps control humidity.
- 6. Tight HVAC ductwork**  
Tight ducts can help lower your energy use, improve the air quality in your home, and maintain a comfortable temperature.
