# SAFE

Be safe and healthy on the job with these helpful tips provided by Peabody Insurance Agency.

## Avoid Back Pain

*Proper lifting techniques can prevent injuries*

Lifting can be a very common activity in your role. And while you may not see it as a safety hazard, lower back injuries are the most common work-related injury. Following these simple guidelines and learning to lift properly today will help you to avoid back pain tomorrow.

### Proper Lifting Techniques

- Wear gloves if you are lifting rough equipment.
- Clear away any potential obstacles before beginning to carry an object.
- Get a good grip and good footing. Use your hands, not your fingers, to grip the load, and position your feet so that one foot is next to the load and one is behind it.
- Get under the load by bending your knees, not your back. This is the most important lifting technique to remember, as bending over at the waist to reach for the object puts strain on your back, shoulder and neck muscles, and can cause serious injury.
- Keep the load close to your body.
- Never twist your body when you are lifting. Turn your entire body by using your feet.
- Do not lift above the shoulders or below waist level.

### Size up the Load

Before lifting an object, check its weight. Decide if you can handle it alone or if you need assistance. When in doubt, ask for help. Moving an object that is too heavy or bulky can cause severe injury. As a general rule, most men should not lift more than 37 pounds, and most women should not lift more than 28 pounds. If a particular load is heavier than you can handle:

- Get someone to help.
- Break it down into smaller loads if possible.
- Use dollies or lifts as aids. These tools were made for heavy lifting.

### Team Lifting

When others are helping you lift, teamwork is very important. If you're going to be carrying the load to another point, both of you should coordinate this prior to lifting the object. Check the route and clearance. One worker needs to be in a position to observe and direct the other. Lifting and lowering should be done in unison. Don't let the load drop suddenly without warning your partner.

### Get Fit!

People who are in poor physical condition are at greater risk for back problems. A conditioning program that includes aerobics, weight training and stretching exercises will help you prepare your body for the rigors of lifting.

### Stay in the Zone!

When you are lifting an object, always keep it in the zone. This means keeping it between your shoulders and your knees. Lifting or carrying anything outside of this zone can cause serious back injuries.
