dental implants
the new standard of care

dental implant therapy

Conventional dentistry such as crowns, bridges and dentures address the short-term cosmetic problem of missing teeth, but require grinding down healthy teeth leaving them at greater risk for cavities and failure. With dental implants, healthy teeth are not compromised. Chewing stimulates the jaw, which prevents bone loss. Leading dental organizations recognize dental implants as the standard of care for tooth replacement.

treatment options

untreated missing tooth
- unattractive smile
- loss of chewing ability
- accelerated bone loss

traditional crown & bridge
- grinds down healthy teeth
- bone loss continues
- greater risk for cavities and tooth failure

Dental implant with a crown
- full chewing ability
- preserve healthy teeth
- prevent bone loss
prevent premature aging with dental implants

When a tooth is lost, the jawbone begins to shrink and becomes brittle from lack of exercise. Losing teeth not only affects your smile, it also changes the shape of your face causing you to look prematurely aged.

Dental implants prevent premature aging and bone loss caused by missing teeth.

dental implant solutions

- **individual dental implants**
  - replace one or more teeth
  - preserve healthy teeth
  - prevent bone loss

- **permanently-secured denture**
  - replace all upper or lower teeth
