

The Weather-Tite™ Roofing System is engineered to maximize protection in rough weather. To ensure optimum effectiveness, a roof must be installed according to BP's application instructions and respect the 5 KEY STEPS OF THE WEATHER-TITE ROOFING SYSTEM:

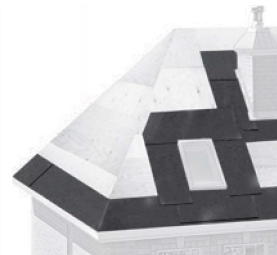

BP'S COMPLETE WEATHER-TITE™ ROOFING SYSTEM

1

BP EAVE PROTECTORS

Considerable damage to the eaves can be caused by ice that builds up during the winter freeze/thaw cycles. **WeatherTex**™ or **Grippard** waterproofing membrane will provide the protection you need.

2

BP UNDERLAYMENTS

High-performance **Suredeck**, **BP lined asphalt felts**, or **BP Deckgard** provide top notch secondary protection from water driven under the shingles by high winds.

3

BP STARTER STRIP SHINGLES

Cost-effective **BP Starter Strip shingles** or **cut-off classic 3-tab shingles** reduce installation time and waste by eliminating shingle scraps, and also provide excellent protection against wind and water infiltration.

4

BP SHINGLES

BP premium architectural shingles ensure maximum protection and feature our Weather-Tite™ technology with two bands of high-tack adhesive and come in a rich palette of designer colours. Our **classic 3-tab shingles** deliver proven performance, long-term durability, and a wide selection of colours.

5

BP HIP & RIDGE

Cut-off **BP Accu-Ridge** or **classic 3-tab shingles** cap your roof with peak protection while adding an attractive finished look.
