

IS PRP SAFE?

Yes. PRP has been used clinically for over two decades. It has been used for wound healing, orthopedics, dental, open-heart, reconstructive and plastic surgery and anti-aging regenerative applications. Because PRP is made from your own blood, it is insulated against the risk of disease transmission and inflammatory immune responses. PRP is processed in the same room as your treatment and under physician's control.

HOW IS PRP

ADMINISTERED?

You are comfortably seated while your blood is drawn. The blood is then transferred to a centrifuge device in the same room. The centrifuge separates your red blood cells, plasma and platelets. The platelets are then extracted and ready to inject into your scalp or microneedle onto your face. A ring block with local anesthesia is performed so that you do not experience in discomfort during the injection of your PRP.

STEM CELL THERAPY

UCB

(umbilical cord blood hematopoietic stem cells)

Stem Cell Therapy is one of the latest additions to Regenerative Medicine. It can be obtained from your own fat cells or bone marrow. Now, it can safely be obtained from external sources such as umbilical cord blood. UCB is packed with hematopoietic stem cells that when administered with the signaling capabilities of platelets can offer even better results.
