Neither may the instructions, information and illustrations be disclosed to third parties nor used to create competing products, systems or facilities or assist in such activities in any way.

Operating Instructions Maier Rotary Joints

Series H / HW

B-H_en -Version 3 – 11.01.2010

1 Safety

1.1 Application

Maier rotary joints may only be used as fittings to connect pressurized pipes carrying liquids to rotating pressure systems. Such rotating pressure systems are, for example, rollers through which liquids, gas or steam flow for cooling or heating purposes. **Please refer to the section "Specifications and Spare Parts" for details on approved media and their qualities/properties.** These values are binding for the application. Other media are possible - please contact the manufacturer.

Never modify the rotary joint or tamper with it in any way as this may cause dangers. Install, operate and maintain the rotary joint only as described in these operating instructions. We shall not be liable for any damages or plant interruptions whatsoever resulting from failure to observe these operating instructions.

These operating instructions do not contain all information important for the safe operation of the rotary joint. Also observe all pertinent local and national regulations and legislation concerning workplace safety and prevention of accidents.

Use only genuine or Maier-approved spare parts (standard norm parts). If you use other parts, this may have adverse effects on the safety of the rotary joint. We shall not be liable for any damages whatsoever resulting from the use of such non-approved or non-genuine parts.

1.2 Requirements concerning installation and maintenance staff as well as operators

Only staff who has read and fully understood these operating instructions and who is fully aware of the dangers as well as the appropriate safety measures may work with Maier rotary joints. Such staff must have at least the knowledge of a trained locksmith or industrial mechanic who has experience with pressurized components.

1.3 Dangers

Warning!

Touching hot parts or coming into contact with hot liquids escaping under high pressure may result in dangerous burns.

⇒ **Mount a protective hood to the rotary joint in order to prevent persons from directly coming into contact with hot parts and to safely retain escaping media.**

Warning!

If the rotary joint blocks and rotates along with the roller, the hoses may be torn off and hot liquids can escape under high pressure.

⇒ **Always observe the design and mounting information in chapter 3. Monitor the rotary joint by means of a torque sensor or a vibration sensor. Ensure that the rotary joint is regularly maintained as per chapter 7.**

1.4 Safety precautions

Always observe the following safety precautions for the operation of the rotary joint:

- H/HW rotary joints must be overhauled when the wear mark (groove) at the rotor becomes visible (refer to section 7.2 on page 9).

Operating Instructions Maier Rotary Joints

Series H / HW

B-H_en -Version 3 – 11.01.2010

2 Design and functions

2.1 Components

- B, C Housing connections for the medium.
Only one connection for mono flow version.
- D Sealing element (sealing cone, flat packing or O-ring)
- G Housing, stationary flow
- I Inner pipe for duo version
- L Rotor, rotates with the roller
- R Antirotation fork
- W Roller
- DR Sealing ring
- GL Slide bearing

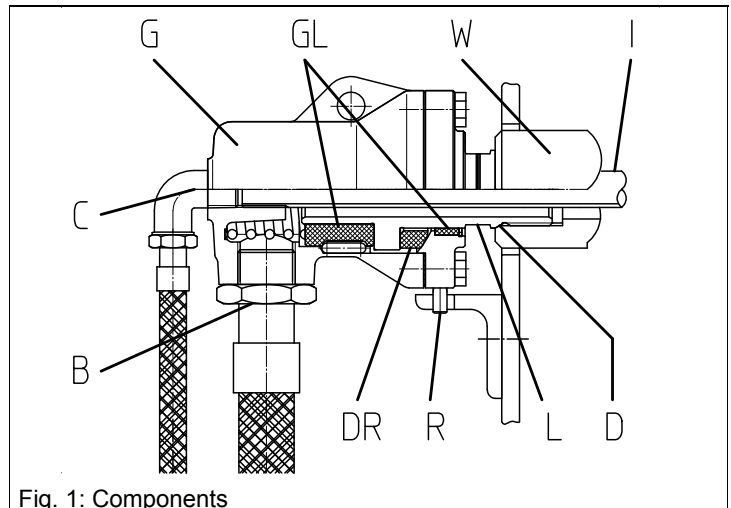

Fig. 1: Components

2.2 Functions and versions

Maier rotary joints are fittings used to connect pressurized pipes to rotating pressure systems. Such rotating pressure systems are, for example, rollers through which liquids, gases or steamflow for cooling or heating purposes.

Rotor "L" is the part that rotates with the roller while housing "G" is the stationary part of the rotary joint. The housing is supported by two slide bearings "GL" at the rotor made of artificial carbon. A special sealing ring "DR" made of artificial carbon is used to seal the medium against the atmosphere at the transition point from the stationary to the rotating parts. Wear of the sealing ring causes an axial movement of the housing (away from the roller). This movement must not be obstructed or prevented, otherwise malfunctions will occur. Antirotation fork "R" is used to prevent rotation of the housing.

Series H / HW rotary joints are available in different housing and rotor versions.

Housing connections:

The following rotary joint versions are available:

Mono flow version: housing with one connection for supplying or removing the medium to or from the rotating pressure system (version 1)

Operating Instructions Maier Rotary Joints

Series H / HW

B-H_en -Version 3 – 11.01.2010

Duo flow version: housing with two connections for supplying and removing the medium to and from the rotating pressure system. The second channel is formed by an inner pipe that is centered in the center axis of the rotating part.

The design of the inner pipe differs in terms of the following versions:

- Stationary inner pipe (version 2 or X 2): The inner pipe is screwed into the housing or the elbow (standard version always with right-hand thread).
- Rotating inner pipe supported in housing (version R 2): The internal pipe is supported by a self-lubricating slide bearing in the stationary housing. There is wear at the bearing point.
- Rotating inner pipe for static bearing in the rotating part of the rotary joint (rotor) (versions A 2 and B 2): The inner pipe is held by a bushing in the rotor (version A 2: for precise separation of supply and return with additional sealing; version B 2: gap seal). There is no wear at the bearing point.

Three way version: Housing with three connections for supplying steam, removing condensate and vacuum valve as negativepressure safety device for thin-walled dry cylinders.

Two inner pipe designs are available: versions 3 and R 3 (see duo flow version).

Rotor connections:

The connection to the rotating pressurized system is made by the rotating part of the rotary joint – the rotor. The rotor is mounted to the rotating pressure system (e.g. a roller) by means of a right-hand or left-hand thread R / L or a flange K. The system is sealed by means of a sealing cone, flat packing or an O-ring.

Please refer to our catalog and the corresponding drawing for further information.

3 Information on design and mounting

**Attention!****Damage to components due to vibration and heat expansion.**⇒ **Use only flexible hoses to connect the rotary joint!**

- Use flexible elements (metal hoses or joint compensators for DN > 125 / 5") for the connection between the supply pipe system and the rotary joint housing. This compensates for heat expansion and vibrations.
- Never apply torsional, tensile or pressure forces to metal hoses. Observe the minimum bending radii quoted by the hose manufacturers. Never use axial compensators without strain relief since the hydraulic response forces would destroy the bearing point in the rotary joint.
- Use flat packings made of pure graphite to securely seal flange connections.
- Only operate the rotary joint with a sufficiently dimensioned torque support to prevent rotation of the housing. The support element must allow for axial and radial movements of the housing. If the axial movement is obstructed due to wear at the sealing ring (away from the roller), leakage will occur.
- Install an additional safety unit:
Install a torque monitoring system or a bearing monitoring system with connection to the emergency shutdown system in order to avoid bearing damages and consequential damages. Please refer to the section "Specifications and Spare Parts" for details on the maximum admissible friction torque.
If the monitoring system is activated, the rotation of the roller should be stopped immediately and the supply of the medium should be interrupted from the flexible supply elements.
- Center the inner pipe and the roller as well as the rotary joint. Out- of-round and axial tension will lead to malfunctions of the rotary joint.
- For smooth operation of rotary joint ensure concentricity and minimum out-of-round tolerance at roller or intermediate flange.
- In the case of a rotary joint with rotating inner pipe – version HR / HWR - it is recommended to use a stainless steel inner pipe or at least a hard chromium-plated bearing seat.
- Series H / HW are mostly used for water, steam and thermal oil. In order to ensure maximum reliability and service life of the seals in the rotary joint, the media used should conform to the specifications listed in "Specifications and Spare Parts". Please inquire for other media.
- Special versions:
See the part "Specifications and Spare Parts" of the operating instructions for additional information on proper and safe operation.

4 Transportation and storage

- Use suitable lifting gear to transport rotary joints weighing more than 25 kg (55 lbs).
- The rotary joints may only be stored in the original packing.
- Make sure the storage conditions specified in the "Specifications and Spare Parts" are met.
- If the rotary joint itself or the facility in which the rotary joint is installed is to be preserved, make sure the preservation agent and the seals of the rotary joint are compatible.

Operating Instructions Maier Rotary Joints

Series H / HW

B-H_en -Version 3 – 11.01.2010

5 Mounting

5.1 Mounting the rotary joint to the roller

- For duo flow version, mount the inner pipe J as described:
H 2 / HW 2: screw it into the housing.
HR 2 / HWR 2: insert it into the slide bearing (center it, avoid tension).
HWB 2 / HWA 2: insert it into the rotor. Do not damage the O- ring in the rotor (version HWA 2)!
- Mount rotary joint 1 to roller W:
as per drawing A with thread at rotor
as per drawing B with K flange 2 and inner ring 3
- Seal with a sealing cone DF (for rotor with thread R/L) or flat packing 7 (for rotor with K flange).
- Fasten the rotary joint with screw 8 or stud bolt 9 and nut 10.
- Clean sealing surfaces DF, apply mounting paste and place the sealing element into roller W (drawings B).
- Recommended material for flat packing:
pure graphite with metal mesh.
- Mount K flange 2 with screws over rotor 80 and place inner ring 3 into rotor groove.
- Lift the rotary joint and insert it into the centering unit of the roller.
Versions with inner pipe: the inner pipe must be centered to the rotary joint and the roller. If you encounter resistance, check for correct position. Out-of-round and axial tension cause malfunctions of the rotary joint.
- Mount screws 8 or nuts 10. Maximum admissible torque as per "Specifications and Spare parts".

Attention:

- When sealing with flat packing, do not fully tighten the screws until you have aligned the rotary joint as per section 5.2!
- Assure the minimum distance $MA \geq 1 \text{ mm (0.04")}$ - otherwise leakage will occur at the sealing element and the rotary joint and the inner pipe will be damaged.

Note:
For smooth operation of rotary joint ensure concentricity and minimum out-of-round tolerance of roller.

Fig. 2: Mounting the rotary joint to the roller

Operating Instructions Maier Rotary Joints

Series H / HW

B-H_en -Version 3 – 11.01.2010

5.2 Aligning the rotary joint, sealing with flat packing

- Place dial gauge M from the idle machine frame MG onto the rotary joint.
- Rotate roller W until the dial gauge is at the bottom dead center UT. Mark the pointer position.
- Rotate roller until you reach the upper dead center OT.
- Tighten the bottom screws Su until the dial gauge is in the center position.
- Repeat this alignment process until you reach the concentricity tolerance specified in the table.
- Tighten the screws with the admissible torque as per "Specifications and Spare Parts"!

Fig. 3. Aligning the rotary joint (symbolic representation)

Admissible concentricity tolerance

DN mm	DN inch	n (min ⁻¹) rpm		
		≤ 40	≤ 100	> 100
15-50	½ - 2	± 1 mm ± 0.04"	± 0.5 mm ± 0.02"	± 0.2 mm ± 0.0078"
65-100	2½ - 4			
125-300	5 - 12			

5.3 Connecting the rotary joint

Attention!

The rotary joints must never run dry since this may damage the sealing components. Exception: test run for a maximum of 30 minutes at a very low speed.

- Mount anti-rotation device 3 of the rotary joint housing / torque monitoring system.
- Connect the housing.
- Special versions:
See the part "Specifications and Spare Parts" of the operating instructions for additional information on proper and safe operation.
- Route the hoses as shown in fig. 4.
- Do not route the hoses as shown in fig. 5.

Fig. 4. Connecting the rotary joint

Observe the information in section 3!

Operating Instructions Maier Rotary Joints

Series H / HW

B-H_en -Version 3 – 11.01.2010

6 Operation

Attention!

Danger of damage to the rotary joint if it is not operated as per instructions.

- ⇒ **Never operate the rotary joint beyond the application data limits specified in "Specifications and Spare Parts"!**
- ⇒ **Observe the limitations specified in section 1.1 on page 2!**

6.1 Observe and check during operation

Check the following during operation:

- Check for concentric arrangement of the rotor to the roll journal. The radial run-out at the rear area of the housing must not exceed the limits listed in section 5.2. Place a dial gauge from the idle machine frame onto the rotary joint housing to check.
- Check the quality of the medium in the system and record the values.
- Check the rotary joint for visible leaks. The operating behavior of the seal installed does not change suddenly. If the seal is beginning to fail, this is indicated by slowly increasing leakage. Regular checks allow you to acquire experience values concerning the operating behavior of the rotary joint installed in the system.
- Special versions:
See the part "Specifications and Spare Parts" of the operating instructions for additional information on proper and safe operation.

6.2 Trouble shooting

Problem	Reason	Repair
Leakage	<ul style="list-style-type: none"> – Seal damaged or worn out. – Obstruction of the axial motion (up to 15 mm / 0.59") caused by wear or heat expansion. 	<ul style="list-style-type: none"> – Completely overhaul the rotary joint! – Check hoses and anti-rotation unit (obstruction is not permitted)
Friction torque too high	<ul style="list-style-type: none"> – Application data exceeded (pressure, temperature, speed) 	<ul style="list-style-type: none"> – Avoid the combination of maximum values.

Series H / HW

B-H_en -Version 3 – 11.01.2010

7 Maintenance

7.1 Safety during maintenance

Only staff who has read and fully understood these operating instructions and who is fully aware of the dangers as well as the appropriate safety precautions may work with Maier rotary joints. Such staff must have at least the knowledge of a trained locksmith or industrial mechanic who has experience with pressurized components.

Perform work on the rotary joint only when the machine/system is idle.

Allow the rotary joint to cool down before you take up work or wear safety equipment to protect against the heat.

Always wear safety glasses when performing work on the rotary joint to protect against escaping medium.

Use only genuine or Maier-approved spare parts (standard norm parts). If you use other parts, this may have adverse effects on the safety of the rotary joint. We shall not be liable for any damage whatsoever resulting from the use of such non-approved or non-genuine parts.

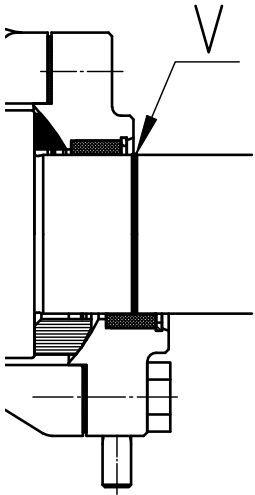

Maier offers on site specialist service. We can also train your service staff - just get in touch with us!

If you have to remove protective equipment to perform the work, reinstall such equipment when you are done and check it for proper operation.

Make sure to properly tighten all screws (see sheet "Specifications and Dimensions").

Always observe the safety information in chapter 1 on page 2.

7.2 Maintenance plan

Interval	Activity	Explanation
Every 12 months	<p>If groove "V" (indicates wear) is visible at the rotor, overhaul the rotary joint.</p> 	By Maier customer service.

Rotary joints series H – HW feature carbon bearings and thus do not require relubrication.

Attention!

Danger of damage if the rotary joint is not operated as per instructions.

- ⇒ **The specifications listed in this document are binding.**
- ⇒ **Never operate the rotary joint beyond the application data specified!**
- ⇒ **Use only approved media!**

We shall not be liable for any damage whatsoever caused by failure to adhere to limit values or use of unsuitable media!

Specifications and Spare Parts

Series H / HW – DN 15 – 100 (1/2" - 4")

S-H(1)_en -Version 6– 18.06.2010

Approved media for the pressure pipe

Series H / HW may be used for water, steam and thermal oil having the quality described below. Other media including additives (e.g. anticorrosion or antifreeze agents) must be checked for compatibility with the sealing materials in the manufacturer's plant.

Specifications - standard media

General

The quality of the medium used plays a decisive role in the service life and reliability of Maier rotary joints. It is strongly recommended to observe the specifications listed below. Insufficient quality of the medium will result in heavy wear of the sealing and premature failure of the rotary joint.

Section 1: Water at temperatures -10°C to 70°C (14°F to 158°F)

- Raw water: drinking water quality
- General: clear, no sediments
- Filtration: particle size 20 µm (788µin), max. 50µm (1969 µin)
- Water hardness: < 3,2 mmol/l (322 ppm CaCO₃)
- If required, add a suitable antifreeze agent and a **silicate-free** anticorrosion agent (ensure compatibility with the materials used in the unit, check back with manufacturer, if necessary).

Section 2: Water at temperatures of ≥ 70°C (158°F) and boiler water for steam ≤ 220°C (428°F)

- Raw water: drinking water quality
- General: clear, no sediments
- Filtration: particle size 20 µm (788µin), max. 50µm (1969 µin)
- Water hardness: < 3,2 mmol/l (322 ppm CaCO₃)
- Low salt concentration according to VdTÜV- Guideline TCh 1466 "Guideline for Circulation Water in Hot Water and Warm Water Heating Systems" ("Richtlinie für das Kreislaufwasser in Heißwasser – und Warmwasserheizungsanlagen), sheet 1
- If required, add a suitable antifreeze agent and a **silicate-free** anticorrosion agent (ensure compatibility with the materials used in the unit, check back with manufacturer, if necessary).

Section 3: Thermal oil

- Material groups:
 1. Thermal oil consisting of hydrocarbons (mineral base, group 1)
 2. Thermal oil made of isomer mixture (synthetic base – group 2)

Only upon request
Thermal oil consisting of uniform material (synthetic base – group 3)
 - General: clear, no sediments
 - Filtration: particle size 50 µm (1969 µin), max. 100µm (3937 µin)
 - Steam pressure*: The steam pressure must not exceed 0.5 bar (7.25 psi) abs at maximum operating temperature.
- *: Steam pressure is the pressure at which a liquid becomes gaseous. The steam pressure depends on the temperature of the liquid.
- Specific heat conductivity: For maximum heat dissipation in the sealing gap, the value should be as good as possible.
 - Kinematic viscosity: For excellent flow in the system and lubrication effect in the rotary joint, the following values should be attained:
 - as low as possible at minimum application temperature
 - as high as possible at maximum application temperature.

Please inquire for media not listed.

Specifications and Spare Parts

Series H / HW – DN 15 – 100 (1/2" - 4")

S-H(1)_en -Version 6– 18.06.2010

Friction torque

Friction torque is essential in designing drives and the safety device for torque monitoring. The values listed relate to measurements with water at 20°C (68°F). The operating pressure is the main factor of influence on the friction torque – in addition, speed, operating pressure and the medium play a role, but to a lesser degree. Therefore, variations of up to ± 20% are possible. The initial breakaway torque during commissioning and after longer idle periods may be twice as high as the values listed.

1 Housing 1	* 20a Sealing ring
2 Housing 2	* 21 Cover bearing
3 Housing 3	* 22 Flat packing
4 Housing R2	* 23 Complete cover
* 6 Rotor R	* 24 Carbon bearing bush
* 7 Rotor L	25 Pressure spring
* 8 Rotor K	26 Hex screw
* 13 Slide bearing	27 Locking pin
14 Vacuum valve	28 Locking ring
15 CU seal	29 O ring vacuum valve
* 20 Sealing ring	

* = wearing part

Repair

Repair is required during preventive maintenance or when leaks are detected between cover 23 and rotor 6-10.

Dismantling the unit

- Unscrew screws 26 at cover 23. **ATTENTION: The internal parts are under spring tension.** To slowly reduce the tension, use two threaded rods.
- Lift off cover 23. All internal parts can now be removed from housing 1-4. **Caution:** carbon bearing 24 may be difficult to remove!
- Remove cover bearing 21 from cover 23.
- Version for rotating inner pipe: remove slide bearing 13 from housing 4.
- Version H 3: unscrew vacuum valve 14 from housing.

Evaluating the parts

- The quality of the sealing surfaces of sealing ring 20/20a, rotor 6-10 and cover 23 is of particular importance. These parts are precision-turned. Therefore, always replace sealing ring 20/20a. Reuse rotor 6-10 and cover 23 only if turning of the sealing surface is still possible. Size DN 65 (2½") and greater: maximum turning tolerance at rotor is 1 mm (0.0393"). **ATTENTION!** If you detect scoring on the sealing surface of rotor 6-10 and cover 23, it is not sufficient to replace only the sealing ring 20/20a!
- Lap sealing ring 20/20a (rotor and cover 23 (fig. 2)), 2 mm (0.0787") wide. Use lapping paste (S). Then clean the parts with an agent which does not leave any residue.
- Replace cover bearing 21, flat packing 22, carbon bearing 24.
- Version H 3: check function of vacuum valve, replace, if necessary. Replace sealing ring 15 and O-ring 29.

Reassembling the unit

- Version with rotating inner pipe: press slide bearing 13 into housing 4.

- Place compression spring 25 into housing 1-4.
- Insert carbon bearing bush 24 and locking pin 27 into housing 1-4. The arrow must point towards the compression spring. Observe position of the groove in the housing (attention: danger of damage).
- Insert rotor 6-10 into housing 1-4.
- Fit sealing ring 20/20a onto rotor 6-10.
- Fit cover 23 and flat packing 22 onto housing and carefully tighten the cover by means of screws 26 (apply even torque).
- Function check apply axial load on the rotor to compress springs. If axial displacement of 2 - 3 mm (0.0787" - 0.118") is possible, the unit has been properly reassembled.
- Retighten screws 26 after a short operating period.
- Version H 3: screw vacuum valve 14 with CU sealing ring 15 into housing 3.

ATTENTION! Never oil or grease the sealing surfaces!

Spare parts

It is recommended to stock the wearing parts mentioned above. Always specify the part number and the complete type designation of the rotary joint as per data plate when ordering spare parts.
