

## Standard Lining

We use only 100% cotton lining to the highest standard designed to withstand the effects of light for twice as long as other standard cotton and mixed linings without fading. This lining has a crease resistant finish and is used to line curtains of medium to heavy weight. Our cotton lining is typically available in ivory white and pearl, although some coloured linings are also available. Not only will the lining help the curtains to hang correctly they will also provide a degree of privacy to sheer fabrics.

## Blackout Lining

Certified 100% blackout means that no light will pass through the fabric, however, this applies only to the fabric itself, you may get light seepage around the sides of blinds and curtains, and light will seep through the eyelets on eyelet curtains.

The lining fabric has a coating which fills the tiny gaps in the weave of the fabric, but as it's super-soft it doesn't make the lining stiff and unyielding, ensuring that your

curtains and blinds still have their beautiful folds and pleats. Just because it's called blackout lining it isn't black in colour! Blackout lining is available in various of colours including white and cream. It also has thermal qualities, so it will help reduce heat loss from your room and minimise the amount of cold air entering via the windows.

## Interlining

Interlining provides another layer of fabric between the face of the fabric and the lining. Using interlining will give you fuller more rounded, opulent pleats to your curtains. Most interlinings also have thermal properties, so they'll help to block out draughts and reduce heat loss. This type of lining is ideal for door curtains and full length curtains.

## Thermal Lining

Doing as the name implies thermal lining is an effective way to help keep heat in your rooms and cold air out during the cooler months. In summer thermal linings also help to keep rooms cooler. They are available in a range of widths and have a three layer backing which gives the fabric its thermal properties. Thermal lining can be used for both curtains and blinds.
