BNE

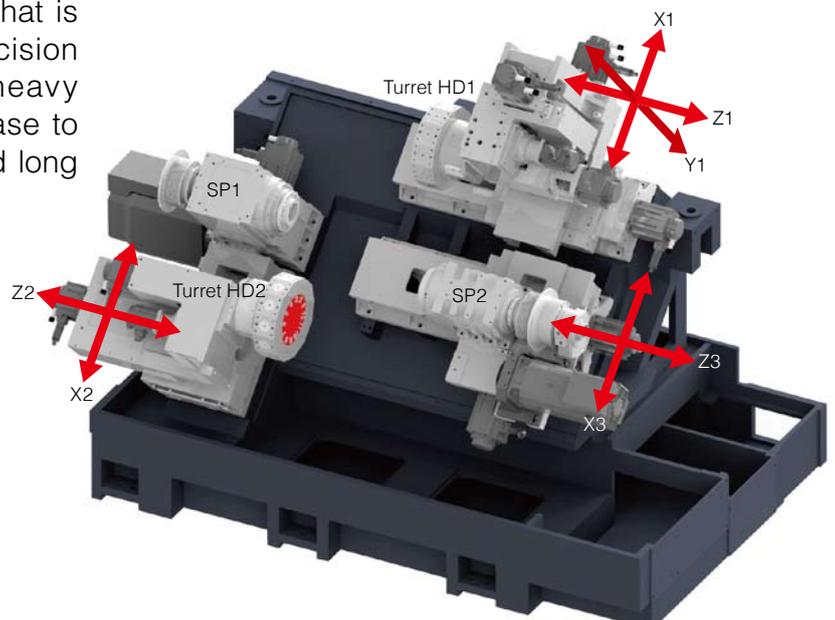

BNE-5IMSY

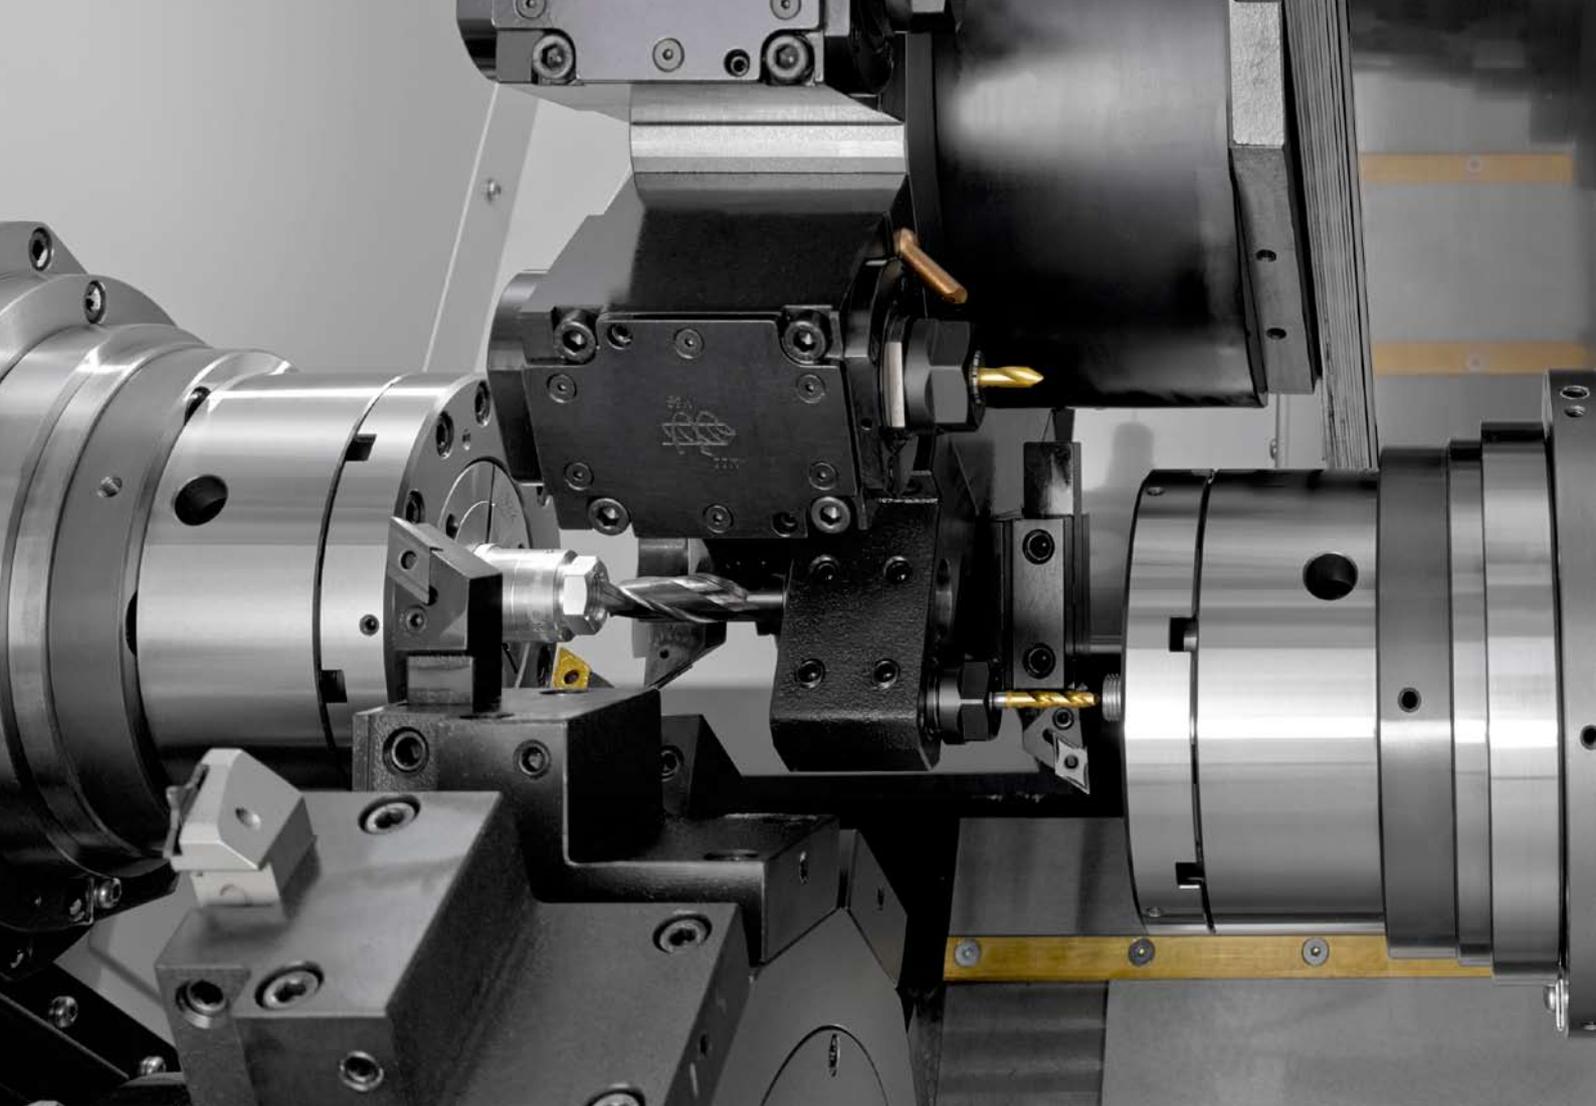

The BNE series is renowned for its high rigidity, heavy cutting capability and outstanding precision. The new MSY model extends the ability of the BNE series with the adoption of X3 axis on the back spindle (SP2) and synchronized / superimposed control for 3-tool simultaneous machining. Faster cycle times, outstanding easy-of-use and the ability to machine complex work pieces is the result.

Machine structure

The basic construction of the machine, that is the combination of the highly rigid precision scraped square guideways and the heavy slanted bed cast in one piece, is the base to support high precision, heavy cutting and long tool life even in complex machining.

Examples of simultaneous machining with three tools

Turret

Indexing by a large-diameter curvic coupling, secure hydraulic turret clamping and rugged square guideways assure high precision and long life of the turret without compromise. This turret can accommodate revolving tools with a high machining torque of 20 Nm at all 12 positions.

Our unique tool holder mounting method using two guide pins makes it easy to mount and remove tool holders and ensures exceptionally high re-mounting accuracy.

Spindle

A combination of "precision double-row cylindrical roller bearings" and "precision angular contact ball bearings" suppresses radial run-out and thermal displacement in the longitudinal direction as well as providing high rigidity.

Comprehensive machining patterns

Equipping SP2 with an X3-axis has enabled simultaneous hole machining on both end faces, which was not possible on conventional BNE models. In addition, superimposition control allows simultaneous cutting with two tools by synchronizing the cutting at SP2 with the cutting at SP1, and also simultaneous cutting with three tools including SP2, helping to shorten cycle times. So a full range of machining variations is offered.

Convenient operation

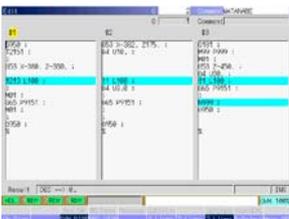

HMI (Human Machine Interface) is adopted
Graphics displayed for each item and screens that display all the necessary information in one place greatly improve operating convenience.

Machining data screen
All you have to do is input the machining length, chucking length and so on, and the escape and approach positions are automatically calculated. This is useful for collision prevention and shortening setup times.

Support for programming
The function displays the list of G and M codes including explanations of the arguments. Canned drilling cycle is designed by dialogue form to support programming.

Easy-to-view edit screen
The coordinate calculation function and calculator function incorporated in the NC unit can be used for complex intersection point calculations.

Calculation function
Programs for canned cycles etc. can be created in the conversational style.

Options

Part catcher
Discharges workpiece on to conveyor.

Revolving tools
Ensures high-power, stable milling at a torque of 20 Nm.

Drill breakage detector
Drill breakage is detected by the swing cylinder. The machine stops when breakage is detected.

Bar loader/ Bar feeder
A choice of Barloaders (max bar length ≈ 1m) or Barfeeders (max bar length ≈ 3.6m) are available.
