Data Analytics

However we define ‘big data’, most seem to agree that today’s proliferation of data can only be tackled with the help of sense-making analytics and technology. We all need the ability to filter and refine data, to extract meaning and insight from it. To capture the opportunities inherent in the data flow, rather than being constrained by information overload.

Threat Intelligence

Cyber-attacks may be of a technical nature, but the motivations behind the attacks are increasingly political, ideological or driven by money and power. The need for geopolitical analysis, monitoring of global events, or obtaining timely intelligence through social media analysis is not part of the offering from traditional IT-security companies. In order to understand and possibly even predict future threats, however, a more holistic approach is necessary. This is also what makes cyber threat intelligence so much more complex, and it’s not just a matter for the Chief Information Security Office (CISO) or Chief Security Officer (CSO). All C-level executives and other stakeholders, up, down and across an organisation, ought to take a serious interest.

Why Silobreaker?

Silobreaker’s analytics process millions of articles from hundreds of thousands of sources with multi-dimensional filters to serve up contextualised views and situation pictures. Customers can monitor hacker groups, hacker ops, attack types and malware in news, blogs, feeds, social media or in other internal or external data. Trending tools highlight what is of specific relevance at any given moment. Access to geopolitical information and other data provides a bigger picture and offers insights into the rationale behind attacks or hacker operations. Visualisations explain the development of cyber threats to specific industries or companies.

Customer Cases

A leading European bank, a US-headquartered global technology company and a police organisation’s cybercrime unit are examples of Silobreaker’s customers and the broad application of our tools. In all these cases, customers are achieving considerably improved situational awareness, beyond the technical parameters of cyber threats, and support for both tactical and strategic decisions.

Silobreaker’s strength is its ability to deal with any kind of data; internal, external, structured or unstructured, supporting companies’ emerging intelligence needs.
Cyber Security & Risk Intelligence

Products
Silobreaker Onlineis our hosted and secure online offering. It comes with all our available tools and features as well as with data in multiple languages from open sources like news, blogs, feeds, forums and social media. In addition, customers can integrate their own data and work with it alongside the external content.

Silobreaker Software is our on-premises software suite. It offers a dedicated and tailored in-house solution that can be delivered and installed behind firewalls. Customers are in complete control of the data to be used and the software can be implemented on its own or as a part of an integrated solution.

ROI
Silobreaker provides two main benefits:

- The substantial time-saving by enabling companies to work more efficiently through large and diverse data-sets in a single system.
- The significant improvement of a company’s situational awareness and knowledge from analysing and interpreting the data more easily.

Testimonials
“What previously has taken weeks to research and complete, we have managed to finish in a single day with Silobreaker.” Senior Cyber Research Analyst, global technology company

“Silobreaker’s innovative product along with exceptional customer service has made this a primary tool in our cyber intelligence research platform.” Manager Threat Intelligence, leading retailer

“There was a major incident last week and the first we knew of it, despite all manner of other confidential feeds was through Silobreaker.” Head of OSINT, naval force

“What can I say, we love your product! Can’t recommend it enough to our partners and when I do speaking engagements Director Counter Threats, global software company

Silobreaker is a data analytics company specializing in cyber security and risk intelligence. The company's online and on-premises products help intelligence professionals make sense of the overwhelming amount of open source data available today and from internal sources. Silobreaker's technology is intuitive user tools for contextualizing and visualizing the information as well for sharing and reporting the results. Customers save time by working more efficiently through big data sets, and improve their expertise and knowledge from examining and interpreting the data more easily. Customers represent a wide range of use-cases across cyber security, risk intelligence, incident management, geopolitical analysis and government and military OSINT. www.silobreaker.com
