Hydration Therapy IV

Being properly hydrated can help flush toxins from our bodies and improve our kidney function. IV supplementation with vitamins can boost our immune systems and reach peak levels in our bloodstream that are nearly impossible to reach with oral drinking. Help your body combat stress and enhance your daily functioning with an individualized IV hydration ‘cocktail’.

Whether you are an avid exerciser, a wine lover, coming down with the flu or for Hangover and jet-lag relief! all of us could benefit from some extra hydration, which is why we are considering adding IV hydration therapy

Is it really that simple? Start hydrating and feel better? The answer is – yes, absolutely! Being dehydrated can lead to the following:

- Fatigue
- Dry skin
- Insomnia
- Constipation
- Headaches
- Dizziness
- Rapid heart rate
- Muscle cramps
- Low blood pressure

A more effective way than oral intake for hydration is intravenous (IV) hydration where fluids are placed directly into veins. The process of being hooked up to an IV is done by an experienced medical professional. IV’s are usually placed into superficial veins in the arms and depending on the amount of fluids recommended, it usually takes 45 minutes to infuse the fluids.

What is Intravenous Therapy?

Intravenous Therapy is the infusion of fluids directly into the bloodstream using a minimally invasive procedure. By using IV delivery, 100% of the administered dose of nutrients, minerals and fluids are absorbed immediately on a cellular level and provide fast relief from a number of ailments.
