Goldmectin® LV Ivermectin Oral Paste for Horses

For treatment and control of susceptible roundworms, tapeworms, bots and skin lesions caused by Habronema, Draschia and Onchocerca* spp.

Active Constituent
Ivermectin 18.7 mg/g
Praziquantel 140 mg/g

Pack Size
7.49g Syringe

Convenient low volume, broad-spectrum wormer. Suitable for horses <700Kg BW.

Directions For Use
At the recommended dose level of 1 mL/100 kg, GoldMectin LV Ivermectin Oral Paste for Horses controls the following parasites:

Large Strongyles: Strongylus vulgaris (adults and arterial larval stages), Strongylus edentatus (adults and tissue stages), Strongylus equinus (adults) and Tridontophorus spp. (adults).

Pinworms: Oxyuris equi (adult and immature).

Ascarids: Parascaris equorum (adult and immature)

Hairworms: Trichostrongylus axei (adult).

Large Mouth Stomach Worms: Habronema muscae (adult).

Neck Threadworms: Onchocerca* spp. (microfilariae).

Bots: Gasterophilus spp. (oral and gastric stages)

Lungworms: Dictyocaulus arnfieldi (adult and immature).

Intestinal Threadworms: Strongyloides westeri (adult).

*These parasites have not to date been recorded in New Zealand.

GoldMectin LV Ivermectin Oral Paste for Horses is also effective for control of skin lesions caused by Habronema and Draschia spp. cutaneous larvae (summer sores), and Onchocerca* spp. microfilariae (cutaneous onchocerciasis).
Dosage and Administration
GoldMectin LV Ivermectin Oral Paste for Horses is given orally at the recommended dose level of 1 mL/100 kg bodyweight. The dose of 1 mL/100 kg bodyweight delivers 0.2 mg/kg of IVERMECTIN and 1.5 mg/kg of PRAZIQUANTEL. The contents of this syringe will treat one horse at 700 kg bodyweight. Each weight marking on the syringe plunger will deliver 1.07 g of paste which is sufficient to treat 100 kg bodyweight.

Insert the syringe into the side of the horse’s mouth in the gap between the front and back teeth. Advance the plunger as far as it will go, press the plunger to the chosen dosage, depositing the medication on the rear of the tongue. Immediately raise the horse’s head for a few seconds after dosing to ensure the full dose has been swallowed.

Suggested Parasite Control Programme
All horses should be included in a regular parasite control programme with particular attention being paid to mares, foals and yearlings. Foals should be treated initially at 6 to 8 weeks of age, and routine treatment repeated as appropriate.

General Directions
Broad Spectrum: GoldMectin LV Ivermectin Oral Paste for Horses kills all the important internal parasites of horses including the arterial stages of S. vulgaris and tapeworms and bots, with a single, easy to administer, dose. Because re-infection is common, treatment must be repeated routinely for effective control

Safety
GoldMectin LV Ivermectin Oral Paste for Horses has shown a wide safety margin at the recommended dose level. It may be used in horses of all ages. Mares may be treated at any stage of pregnancy. Stallions may be treated without adversely affecting their fertility.

Horse Hack
Whenever possible the decision to deworm should be based on the results of a Faecal Egg Count (FEC). Consult a veterinarian when developing a worm control program to suit your specific needs.
