Welcome to the DSK 24th Annual Bull Sale 2017.

Last year I commented on record high prices & now it has maintained prices never before witnessed for such a length of time. Throughout the past 12 months big returns for producers of quality cattle with high demand for purebred lines of females for an increase within breeding herds across the nation. This world wide demand for beef has been predicted to be sustained into the future for some time & confidence in the beef industry is at an all time high.

New technology is under way to determine carcase yield which will lead to producers with higher yielding cattle being financially rewarded. You could say that at the moment these high yielding bodies subsidise the low yielding ones.

At DSK we have always been conscious of high yield while at no sacrifice to quality. We have a long history of carcase competition & national feedlot & grass trial success in all major east coast events.

This is the reason we have introduced Canadian Angus genetics into our program which is even more evident in this year's draft of bulls with the Young Dale Xcaliber sons showing extra muscle mass.

Our Charolais breeding program is underpinned by our outstanding breeding sire Gold Logie.

Long yearling bulls are included in this sale again offering breeders economical benefits of more calves per bull.

It is gratifying to see our clients topping weaner sales throughout NSW. We are confident our bulls will continue to make our clients profitable in their chosen market places.

We congratulate Ced & Rowena Wise & family on the success of their past Glenisa Bull Sale with sons of DSK RR Feel Good F36 topping the sale average by a good margin again.

Looking forward to seeing you on 17th August & happy to help you with any enquiry about our exciting sale bulls.

Looking After Your New Bull & How Hard Should He Work?

An important understanding of bull management.

Taking care of your new bull after purchase should be viewed as caring for your future genetic and financial investment. How you care for your bull in his first season can affect the long term contribution that your new genetic package will make for your herd. You will find all the pre sale feeding and health information on these sale bulls in this catalogue. Your DSK bull is fully checked, vaccinated and ready to go to work for you. But do you know just how much work he should be able to handle?

Bulls have different maturity stages but as a general rule, DSK bulls are later developers and will continue to grow well into their 3rd year of age. While a bull is still growing and developing and at the same time serving cows and maybe fighting for dominance in a multiple joining situation, he is using much more energy than a bull that has already matured. It is very important to make sure that your new bull in his first season is not overworked and underfed. This will not only affect his ability to serve cows and produce live semen, but it will have a major impact on his growth pattern to maturity which can cost you big bucks when you go to trade that bull in at the end of his working life and sell him by the kilo.

Take your bull home and settle him in for a few days with a few quiet pregnant cows, then either introduce him into his joining mob or settle him into the sires paddock. If you put him into a group of older bulls, he will be at the very bottom of the pecking order and be in danger of serious injury before you have even used him. Make sure that this paddock is large enough that bulls can retire to their own corners when they feel like they have had enough fighting. Most bulls know when it is advisable to leave a losing battle, but they need somewhere to run to. We advise that you insure your new bull for at least the first season in case of injury.

At DSK we recommend the use of single sire mating as a means of reducing injury to your bulls and also a great way of sire identifying your cattle to know which sire lines are doing the best job for your operation. Many feedlotters and prime cattle buyers prefer cattle that are sire identified. This situation can also keep your joining season short and compact. It is important that you keep mobs in a paddock that a single bull can cover, ie, he can see, smell or hear what is happening in his paddock so he doesn't miss cycling cows in small groups. It is a good idea to have a single watering point per paddock, this keeps the mob together and gives your bull easy access to cycling groups of cows.

Unfortunately with single sire mating you run the risk of unforseen infertility in your bulls. It is most important to use bulls that have been semen tested to check for % of live sperm & imperfections, including your older bulls, and make sure that both bulls and females have had all the necessary health vaccinations and are in a condition good enough to be able to fall pregnant while milking for a calf. Check your bull at least twice a week for any lameness or swelling around the sheath or testicles and it is a good idea to try and catch your bull mating a cow to check for penis damage or abnormal serving problems such as "corkscrew penis" where the penis is twisted making mating much more difficult if not impossible. The Australian Association of Cattle Veterinarians defines a normal, fertile bull as "expected to get 90% of 50 normal, cycling, disease free females pregnant within 9 weeks, and 60% of these should become pregnant in the first three weeks of joining." This expectation would apply to 2 year old bulls but not to younger bulls. Mating loads of 25 to 30 females with a frame score that the bull can easily mount are recommended for yearling bulls in a smaller paddock with good feed and water. Try and cut their joining season down to 6 or 8 weeks and pull them out into a good nutrition paddock or hand feed them to allow them to recover body condition and maintain strong growth. The condition of younger bulls is critical for their sperm production and it is recommended that they not be allowed to drop in condition below a fat score 3 during service.

We recommend strongly that you have a backup bull in case of injury or infertility, allow yourself an extra bull in your sire line up. You may even find that lessening your joining mobs in a few cases allows you to have that extra bull out working each season but doesn't over work a few of your bulls so that you can then use one or more of these as a backup bull if you find you need it.

Injury and illness can strike a bull at any time and while most times this can be managed quickly and with complete recovery it is important that whatever is holding your bull back from maximum workload be dealt with straight away. Not only can it be the difference between recovery and total loss but it is also a factor in how quickly your bull gets his mob in calf and that effects the producer bottom line.

We can not stress enough the importance of regularly checking your bulls before, during and after joining to keep the health of your investment in top shape to maintain future herd development and financial success.

Advantages of the Long Yearling Bull (15 to 18 months)

It has been a concern of ours at the high attrition rate of preparing 2 year old bulls for sale that the stud producer faces. Inevitable injuries occur rendering bulls unsaleable due to serious injury or death as maturing bulls sort out their pecking order in the mob. Unlike the law of averages, odds are that the injury is to one of the top bulls and he is lost to the industry. We started the practice of selling Long Yearling Bulls in 2016. These sensibly prepared bulls will easily cover 30-40 females depending on paddock conditions and with sound management should develop suited to their new environment and should give their new owner an extra season or two due to the young bull not being over conditioned as a two year old. Longevity is the key to higher profit in beef production in both bulls and females.

The more calves a bull sires throughout his working life, the cost per calf decreases.

Sire Selection with Chris Knox

Not every beef producer needs the same style of beef sire. This comes about from the wide diversity in our Australian beef markets and the vast difference in operations due to environmental, climate and location. These factors are the reason why we have variations of type and maturity patterns within breeds and individual herds.

This variation in type is a widely used tool in the seed stock industry to adjust our breeding programmes as time moves forward. For example, if you want to keep breeding frame 6 cattle, you can't keep buying frame 6 bulls, every now and then you need to increase your frame score to compensate for a reduction of cow frame over time. We can use the wide variety of genetics and types on offer for the improvement of a single trait or multiple traits. Artificial insemination is a tremendous aid in this way where you can use a tremendous line up of influential individual sires from Australia and overseas to supplement your breeding programmes and widen our national genetic pool. This is why most drafts of sale bulls have a variation within the groups regardless of type of cattle or priorities on particular traits a stud breeder might be working towards in his programme.

Our operation at DSK strives to produce a larger framed animal with good muscle content and fleshing and having an easy finishing ability on a high yielding carcase which maintains a strong commercial focus and in turn will give our bull clients increased profitability throughout their own herds. You will find a variation of type in our sale draft and we feel sure the you will find that bull that will suit your individual need. We encourage clients to discuss your breeding programmes and operations with us so that we may help you to make the right selection for your future marketing options.

Sid

(Harold Dart)
16/7/1937 to 8/7/2017

Sadly lost to us but never forgotten.
Your love of cattle was only beaten by the love & pride you had for your family & many friends.
Your community generosity was immense & you contributed greatly to many great causes.
Many fun days & cold nights spent in the cattle yards or show bar that a sneaky rum would always be good.
We are forever grateful & better off for having had you as our friend.
We miss you.

Angus Recessive Genetic Conditions

Where a single pair of genes controls a trait or condition it is referred to as a simple recessive trait or condition. There may be several forms of the same gene eg black (dominant) and red (recessive) for the colour gene in Angus. These gene forms are called alleles. Two copies of the recessive allele need to be present in an animal for it to be expressed. Both the sire and dam need to be a carrier (have one copy each) to have progeny that have two copies of the recessive allele.

Arthrogryposis Multiplex (AM), Neuropathic Hydrocephalus (NH) and red colour are examples of recessive conditions and traits in the Angus breed. In animals with only one copy of the recessive allele (and one copy of the dominant allele), the recessive allele isn't expressed and the animal is known as a "carrier" for the unexpressed trait or condition.

What happens when carriers are mated to other animals?

A carrier, will on average, pass the recessive allele to a random half (50 %) of its progeny. When a carrier bull and carrier cow is mated, there should be a 25% chance that the progeny produced will have two dominant alleles and so will never pass on the undesirable allele. There should be a 50% chance that the mating will produce a carrier. However, there could be a 25% chance that the progeny have two copies of the recessive allele. If animals free of the recessive allele are mated to carrier animals the recessive trait or condition will not be expressed at all. Approximately half (50%) of the progeny could be expected to be carriers while the other half are expected to be free.

Recessive gene status reporting

Where a DNA test can be used to determine whether an animal is a carrier or free of the recessive gene the status of animals is being reported using five categories. For example, for the AM condition:

AMF Tested AM free – have zero copies of the recessive allele
AMFU Expected to be AM free - based on pedigree analysis
AM__% _% probability that the animal may be an AM carrier
AMC Tested AM carrier – have one copy of the recessive allele AMA AM-Affected – have two copies of the recessive allele

RDC is a tested red coat colour gene carrier and RDF is tested as red coat colour gene free.
Registration certificates and the Angus Australia web-database will display these codes. This information can be accessed by conducting a "Database Search" from the Angus website and clicking on the "Genetic Test Results" link on the animal details page. The status of untested animals is subject to change and will be re-analysed and adjusted each week as DNA test results of relatives are Breedplan Averages for 2016.

Intramuscular Fat (Fleck score) By Roger Evans, Bovine Scanning Services

See on the Supplementary sheet in the Fleck column.

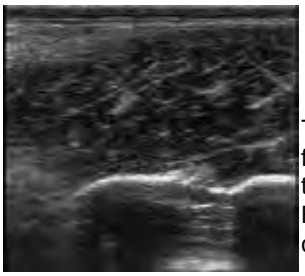
Intramuscular Fat (IMF) is the fat that is deposited within the muscle tissues of the animal. It is of interest to the beef producer because upon chilling of the beef carcase the IMF solidifies to give us marbling. The amount of marbling expressed in the carcase will have a great bearing on the economic value of the carcase and resulting profit to the producer.

The use of real-time ultrasound in measuring IMF can give the bull producer an accurate indicator or the animal's ability to deposit IMF and therefore it's ability to marble.

IMF is measured as a percentage of fat that is within the eye muscle. If an animal has an IMF% of 4.9% then 4.9% of the eye muscle area is IMF. The higher the IMF% then the greater the marbling potential of that animal.

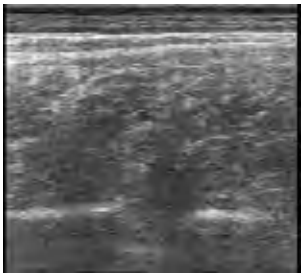
Not only is the magnitude of the IMF% important, so too is the distribution of IMF within the muscle. IMF that is evenly distributed within the muscle will solidify into the fine flecked or honeycomb marbling that is most desired by the consumer. This fine flecking gives a greater consistency of texture, juiciness and flavour from one mouthful to the next.

With this in mind the DSK sale bulls have been assessed for their IMF% and IMF distribution. To assess the IMF Distribution a scale from 1 to 5+ has been developed. The higher the distribution grade reflects a finer and more even distribution of IMF. Animals with a higher distribution grade combined with a high IMF% are desired for the production of high quality beef.



IMF DISTRIBUTION

1	1+	2	2+	3	3+	4	4+	5	5+
Very coarse									Very fine



The picture on the left shows the heavy blotchy look of a 2+ score for distribution while the picture on the right shows the fine even textured distribution of a 5+ rated animal.
Roger Evans has been scoring IMF% distribution for us at DSK for over 17yrs and we have proven it to be highly heritable.

ANGUS & CHAROLAIS BREEDPLAN
Understanding EBVs and Accuracy

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These estimates are called Estimated Breeding Values (EBVs).

In the calculation of EBVs, the performance of individual animals within a contemporary group is directly compared to the average of other animals in that group. A contemporary group consists of animals of the same sex and age class within a herd, run under the same management conditions and treated equally. Indirect comparisons are made between animals reared in different contemporary groups, through the use of pedigree links between the groups.

EBVs are expressed in the units of measurement for each particular trait. They are shown as + ive or - ive differences between an individual animal's genetics difference and the genetic base to which the animal is compared. For example, a bull with an EBV of +50 kg for 600-Day Weight is estimated to have genetic merit 50 kg above the breed base of 0 kg. Since the breed base is set to an historical benchmark, the average EBVs of animals in each year drop has changed over time as a result of genetic progress within the breed.

The absolute value of any EBV is not critical, but rather the differences in EBVs between animals. Particular animals should be viewed as being "above or below breed average" for a particular trait.

Whilst EBVs provide the best basis for the comparison of the genetic merit of animals reared in different environments and management conditions, they can only be used to compare animals analysed within the same analysis. Consequently, ANGUS BREEDPLAN EBVs cannot be validly compared with EBVs for any other breed.

Although EBVs provide an estimate of an animal's genetic merit for a range of production traits, they do not provide information for all of the traits that must be considered during selection of functional animals. In all situations, EBVs should be used in conjunction with visual assessment for other traits of importance (such as structural soundness, temperament, fertility etc). A recommended practice is to firstly select breeding stock based on EBVs and to then select from this group to ensure that the final selections are otherwise acceptable.

EBVs are published for a range of traits covering fertility, calving ease, milking ability, growth, carcase merit and feed efficiency. When using EBVs to assist in selection decisions it is important to achieve a balance between the different groups of traits and to place emphasis on those traits that are important to the particular herd, markets and environment. One of the advantages of having a comprehensive range of EBVs is that it is possible to avoid extremes in particular traits and select for animals with balanced overall performance.

Calving Ease EBVs (%) are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

CE % Direct = Direct Calving Ease - The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

CE % Daughters = Daughters' Calving Ease - The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age.

Gestation Length EBV (days) is an estimate of the time from conception to the birth of the calf and is based on AI and hand mating records. Lower (negative) GL EBVs indicate shorter gestation length and therefore easier calving and increased growth after birth.

Birth Weight EBV (kg) is based on the measured birth weight of progeny, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200-Day Growth EBV (kg) is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

400-Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

Mature Cow Weight EBV (kg) is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weight at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. Steer breeders wishing to grow animals out to a larger weight may also use the Mature Cow Weight EBV.

Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of the daughter's milking ability, inherited from the sire, on the 200-day weights of her calves. For dams, it indicates her milking ability.

Scrotal Size EBV (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

Days to Calving EBV (days) indicates the fertility of the daughters of the sire. It is the time interval between the day when the female is first exposed to a bull in a paddock mating to the day when she subsequently calves. A negative EBV for days to calving indicates a shorter interval from bull-in date to calving and therefore higher fertility. Carcase Weight EBV (kg) is based on abattoir carcase records and is an indicator of the genetic differences in carcase weight at the standard age of 650 days.

Eye Muscle Area EBV (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcase data, adjusted to a standard 300 kg carcase. This EBV estimates genetic differences in eye muscle area at the 12/13th rib site of a 300 kg dressed carcase. More positive EBVs indicate better muscling on animals. Sires with relatively higher EMA EBVs are expected to produce better-muscled and higher percentage yielding progeny at the same carcase weight than will sires with lower EMA EBVs.

Rib Fat and Rump Fat EBVs (mm) are calculated from measurements of subcutaneous fat depth at the 12/13-rib site and the P8 rump site (from live animal ultrasound scans and from abattoir carcases) and are adjusted to a standard 300 kg carcase. These EBVs are indicators of the genetic differences in fat distribution on a standard 300 kg carcase. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcase weight than will sires with higher EBVs.

Retail Beef Yield EBV (%) indicates genetic differences between animals for retail yield percentage in a standard 300 kg carcase. Sires with larger EBVs are expected to produce progeny with higher yielding carcases.

Intramuscular Fat EBV (%) is an estimate of the genetic difference in the percentage of intramuscular fat at the 12/13th rib site in a 300 kg carcase. Depending on market targets, larger more positive values are generally more favourable.

Accuracy (%) is based on the amount of performance information available on the animal and its close relatives - particularly the number of progeny analysed. Accuracy is also based on the heritability of the trait and the genetic correlations with other recorded traits. Hence accuracy indicates the "confidence level" of the EBV. The higher the accuracy value the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives. Even though an EBV with a low accuracy may change in the future, it is still the best estimate of an animal's genetic merit for that trait. As more information becomes available, an EBV is just as likely to increase in value, as it is to decrease. Accuracy values range from 0-99%. The following guide is given for interpreting accuracy:

As a rule, animals should be compared on EBVs regardless of accuracy. However, where two animals have similar EBVs the one with higher accuracy could be the safer choice, assuming other factors are equal.

For further information please contact Angus Australia or Angus BREEDPLAN or the Charolais Society or Charolais BREEDPLAN.

Accuracy range	Interpretation
less than 50%	Low accuracy. EBVs are preliminary and could change substantially as more performance information becomes available.
50-74%	Medium accuracy, usually based on the animal's own records and pedigree.
75-90%	Medium-high accuracy. Some progeny information included. EBVs may change with addition of more progeny data.
more than 90%	High accuracy estimate of the animal's true breeding value.

Sale Information

Sale Location: Please note the sale will be held at the Gunnedah Saleyards, Boggabri Road, Gunnedah, NSW.

Sale will start 1pm, Thu. 17th August. Please bring this catalogue with you to the sale to be sure of having one.

Inspections: All bulls will be penned at the Gunnedah Saleyards by 10am sale day. Private inspections are welcomed and can be arranged prior to sale day at Borah Station, Rocky Glen by calling either the vendors or the sale agents. The DSK Open Day will be held on Saturday, 29th July from 11am to 3pm at Borah Station.

Supplementary Sheets: Current weights, scans and scrotal measures will be available on sale day along with any catalogue alterations or withdrawals & DNA results. Be sure to get one when you arrive.

Insurance: Purchaser to arrange insurance cover where required. A representative will be available on sale day to take care of your livestock insurance needs or contact the selling agents to arrange this for you.

The Vendors and their Agents take all care but no responsibility for lots after the sale has been made.

Rebate: A 2% rebate will be payable to outside agents on condition that they either attend the sale and introduce themselves to the selling agents, or who nominate potential purchasers in writing prior to 5pm on Wed 16th August with the selling agents. Agent rebate is conditional upon full settlement of account within 7 days of sale and will be strictly adhered to.

Transport: The Purchaser will be fully responsible for the safe delivery of their purchases. Bull groups are noted in the individual lot information in this catalogue and will be also provided on the supplementary sheet. It is advised that if bulls of different groups have to be transported together that they are where possible separated into different pens or if that is not possible, packing as tightly as can be arranged and comfortable for the bulls, leaves less room for fights while traveling.The selling agents will act as transport co-ordinators so please do not leave the sale before arranging transport with them. Scott Cooper 0427674411; Patrick Purtle 0428851704; Sam Plevey 0427856223

Bid Card System: The sale will be conducted under the bid card auction system with all standard terms and conditions of sale as stated by the NSW Livestock Agents Association and all potential buyers are required to register all relevant details with the selling agents prior to purchase and a delivery and instruction sheet upon completion of the sale for all purchases. No verbal delivery instructions can be accepted and written instructions must have full contact details of delivery location along with legible directions.

Fertility and Health: Bulls have been fully vaccinated and are up to date as of 15th July including booster shots with 7in1, Pestigard and Vibrovax. Bulls have been drenched with Eprinex Pour On and semen tested and inspected externally and internal palpation by Bovine fertility specialist, Dr Ced Wise B.V.Sc., M.S., Diplomate ACT, M.A.C.V.Sc. All bulls have been tested negative for BVD PI from the State Veterinary Diagnostic Laboratory. Bulls are in good forward condition and are ready for immediate work. Borah Station will be a JBAS 6 for Bovine Johnes Disease with no known cases & is a beef only self replacing herd.

Foot Trimming: Lot 21 and 22 have been shown and lightly foot trimmed. No other bull in this draft has been hoof trimmed at any stage.

NLIS: Please note that it is the purchasers responsiblitly to transfer all lots upon receival unless arranged other wise with your agent. NLIS numbers at sale time will be on the supplementary sheet available on the day.

Fertility Guarantee: Please speak to the vendors within 12 months of sale if you feel you have a fertility problem with your bull. All efforts have been made to ensure your bulls are suitable for work under appropriated conditions. Injuries or infertility due to malnutrition or mistreatment after the sale are the purchasers responsibility.

Bull Groups and Feeding Programmes: All bulls have been pasture raised and lightly finished on a barley grain / straw mix and fed at a 0.5% body weight ration in feed troughs daily as well as ad-lib oaten hay in racks.

Group 1 - A bulls are the rising 2 year old Angus group in a mob of 20.

Group 2 - A bulls are the long yearling Angus bulls and have been running with the group 2-C bulls in a mob of 35 until separation on 7th July and are now a mob of 21.

Group 3 - A bulls are the 2 Angus show bulls Lot 21 and 22 that have been running together since weaning.

Group 1 - C bulls are the rising 2 year old Charolais group in a mob of 20.

Group 2 - C bulls are the long yearling Charolais group that have been running in a mob of 35 along with 2-A bulls until 7th July. Lot 20 was introduced to this mob at this time and is now a group of 12.

Disclaimer: While every care is taken to ensure the safety of all persons and property the vendors and their agents are not liable for any damage or injury caused or contributed to by us or by any other person whether caused or contributed to or by negligence, deliberate act or unlawful conduct. This applies to the owners, agents and their employees of the business activities of CR Knox and HD Alexander. Persons enter the sale pens at their own risk and are discouraged from doing so. Bulls are unpredictable large animals and all care must be taken when handling any livestock.

Bulls will be presented into the ring in groups of 2 or more to try and reduce stress for these animals during the sale. Vendors reserve the right to present bulls into the sale ring in an order not necessarily as shown in catalogue.

Lot 1

STRATHTAY ISOBYX L18+91 (AI)

A standout individual to start the sale and probably the best in many people's opinion. A class act with great dimension in length, width & depth. Great sire appeal with a good sire's head, good testicles, tight sheath with good feet & legs. A heifer's calf & her second calf is in the Brisbane show team & as such an outstanding breeder so early, she will now join our donor team later this year. Isobyx has been a top cow line with great grand dam L18 a consistent show winner and breeder. L114 comes with our strong recommendation with high maternal traits having Hi Road in the pedigree.

Outstanding performance that has to impress. Under current market specs actual carcase weight is the winner with grids close to the $6/kg mark. Dam B73 is a top cow showing lots of depth & capacity with easy doing ability & efficiency in a larger frame. Her sire Yardarm sold for a DSK high of $38,000 & was Brisbane Royal Interbreed Champion in his only showing. B73 is a strong producer with daughters following on in her footsteps.

Pictured; Katherine and Richard Braham with Helen at the 2016 DSK bull sale.

Chris and Helen of DSK Angus and Charolais, would like to congratulate and thank the Roche Group and managers, Richard and Katherine Braham, Jeogla and Wallamumbi Stations for being bulk buyers of DSK bulls every year since 2001. We estimate that well over 100 DSK bulls have successfully proven themselves in the hills and valleys of the Chandler River properties. Richard Braham has been property manager for the Roche Group since 1991 and Katherine Braham has been station administration manager for the group since 1991. Jeogla was purchased by the Roche Group in 1998 & Wallamumbi in 2001. In 2008 the two properties, together with a few smaller, neighbouring landholdings were amalgamated to form Jeogla and Wallamumbi Station with a total area of 13,340ha and a carrying capacity of 16,000 hd of cattle. The cow herd in an average season numbers 7000 breeders. Progeny are now finished on site and direct sold. The historic V1V brand of Jeogla and the V2V brand of Wallamumbi, one of the oldest brands in Australia, are still in use today.

Notes:

Congratulations to Trent Hall, Gunnedah with pens of straight bred Angus steers and cross bred Charolais steers sired by DSK bulls at the Tamworth Classic Feature store sale in Feb this year. Trent has been buying DSK bulls for several years and like many other DSK bull sale clients has been achieving great results with his sales over this time.

Lines of Roche Group bred steers sired by DSK bulls at the 2016 Feb Jeogla and Wallamumbi on property production sale.

Owned in partnership with Moongool stud & breeding exceptional progeny. They have excelled in the show ring & the sale ring & his first daughters are calving out well with good udders & we look forward to their contribution to our herd.

At the recent Charolais National Showcase we exhibited Gold Logie progeny in 4 classes & won all 4. These winners went on to win Junior Champion Bull, Reserve Junior Champion Female & Reserve Intermediate Champion Female. For the 2nd year Gold Logie also won the Sires Progeny class.

DSK Legacy last year was Junior & Grand Champion at Sydney Royal, Charolais National Showcase & Brisbane Royal & went on to win Interbreed Pair at Brisbane Royal.

Gold Logie sired both Junior & Senior Champion bulls at Brisbane Royal last year & probably the first Charolais sire to achieve this feat.

Xcaliber excitement sums up what we think of first progeny of this influential sire. Moderate birth, explosive growth, lots of muscle with width of frame. We were attracted to this sire by the depth of side & extra butt shape in his progeny. Sons have sold to $147,000 at Young Dale in Canada & in 2016 sons won the prestigious Car Load Pen of Bulls at the Denver Stock Show.

We always said we would use a Regent son when we found a good one with genuine shape & this was him. Getting his power from his tank of a dam. Inspected this bull on arrival to James & Ted Laurie's Knowla stud & had to have him. Puts carcase, good skin, strong heads, big testicles & bombproof temperament into his progeny. Sired Knowla Gold Medal winning carcase at Sydney Royal 2017. Highpoint died due to injury & very little semen left so this draft could be the only chance to look at such a strong line of sons.
