INVESTMENT INTENTIONS FOR 2016

Capital investment in new fixed and movable assets is expected to decline sharply in 2016 for the second year in a row. The weakness is concentrated in the mining and oil/gas sector. In other industry groups, particularly those in the public sector, investment is expected to be near 2015 levels.

GDP BY INDUSTRY GROUP

The provincial economy was in recession last year with a 1.4% decline in real GDP. Lower output in the construction industry was the main reason.

SUMMERS JOBS

Summer jobs for students have been hard to find in recent years and 2016 promises to be just as bad.

INVESTMENT INTENTIONS FOR 2016

apital investment is one of the more important economic statistics we track because it is a leading indicator for economic growth, productivity increases, construction activity, and economic diversity. Capital investment in the province peaked at \$20 billion in 2014 before falling back to \$16.5 billion in 2015. All but the most determined optimist was expecting another decline for 2016 intentions. The only uncertainty was about how big the drop would be.

Figure 1 shows the steady increase in investment from \$8.3 billion in 2006 to \$20.0 billion in 2014. This sustained period of growth was equivalent to average annual increases of 13% for eight consecutive years. The drop in commodity prices reversed the pattern. Total capital investment declined by 17% to an estimated \$16.5 billion in 2015. The 18% decline in 2016 will, if not further reduced over the course of the year, bring the total to \$13.6 billion – the same level as in 2010.

Interprovincial Comparison

The expected decline of 18% in new capital investment this year is the highest among the provinces. The national average was a modest 4% drop with increases in Quebec offsetting declines elsewhere in the country.

Over the two years from 2014 to 2016, Figure 2 shows

Figure 1: Total Capital Investment, New Structures, Machinery and Equipment, Intellectual Property, Saskatchewan \$25 \$ billions \$20 \$15 \$10 \$5 \$0 2006 2008 2010 2012 2014 2016 intent Statistics Canada's annual survey of businesses and governments collects actual and intended capital investment in new machinery and equipment, the construction of buildings (except residential), the development or expansion of new mines and oil wells, and investments in intellectual property.

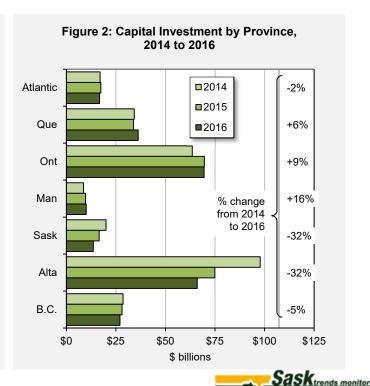

The figures exclude the repair of existing assets which typically adds another 20% to the total. The data measure investment activity in the province, whether it is made by local, national, or international investors. Price inflation is not taken into account – these are nominal figures. The most recent survey was conducted from October 2015 to January 2016 when the price of crude oil was US\$40-45/barrel.

The data are available on CANSIM Tables 029-0045, 029-0048, and 029-0050.

that the 32% decline in Saskatchewan was matched by a similar drop in Alberta. Capital investment in B.C. has also declined. East of the Manitoba border, investment has increased slightly.

Investment by Type

Capital investment is broken down into two categories, namely i) the construction of buildings or other fixed assets such as pipelines or roads and ii) the purchase of machinery, equipment, computers or other movable assets. In some sectors (e.g. agriculture, construction, finance), the mix of investment tends to favour movable assets. In others (e.g. mining, oil/gas, transportation) investment is typically in fixed assets.

Page 3 April 2016

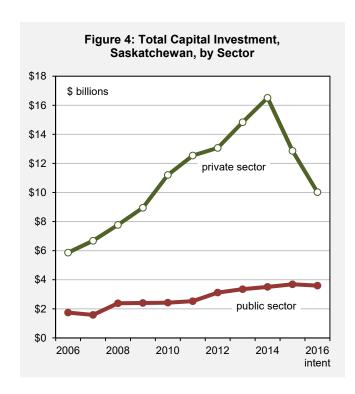

All of the decline in 2015 was in the construction of fixed assets whereas the expected decline in 2016 is evident in both categories. One reason will be that investment in machinery and equipment typically lags investment in fixed assets – the building goes up before the machinery is installed. Another will be that the declines in 2015 and 2016 were concentrated in industry groups that normally invest in fixed rather than movable assets.

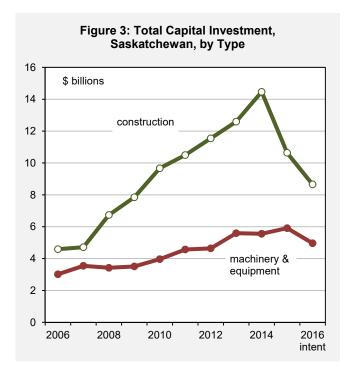

Investment by Sector and Industry Group

Capital investment is further broken down according to who owns the resulting asset and Figure 4 shows that all of the decline in 2015 and 2016 was in the private sector. Investment by the public sector (broadly defined to include health, education, and the crowns as well as government proper) increased by 5% in 2015 and is expected to decline by only 2% in 2016.

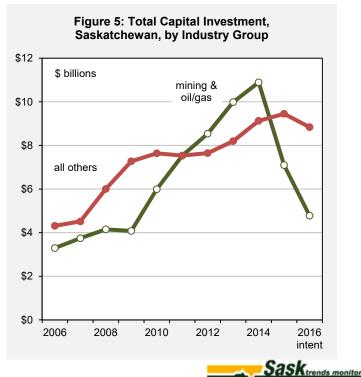

A breakdown by industry group shows the importance of the resource sector in these investment figures. Figure 5 shows that from 2012 to 2014, new investment in the mining and oil/gas sectors accounted for more than one-half of the total. Even with the decline in 2015 and 2016, it is still, by far, the largest single destination for new investment.

Figure 5 also shows how investment outside the resource sector increased in 2015 and that the decline in 2016 is quite modest. The slowdown in capital investment is clearly limited to the resource sector.

The series of figures on the next page shows investment trends in other industry groups. Most show slight declines from 2015 to 2016 but these are not dramatic except for the decline in manufacturing after the equally dramatic increase in 2015. Health care and retail trade are exceptions – both are showing an increase in 2016 intentions. The former will be new health care facilities; the latter will be more "big box" stores.

Page 4 April 2016

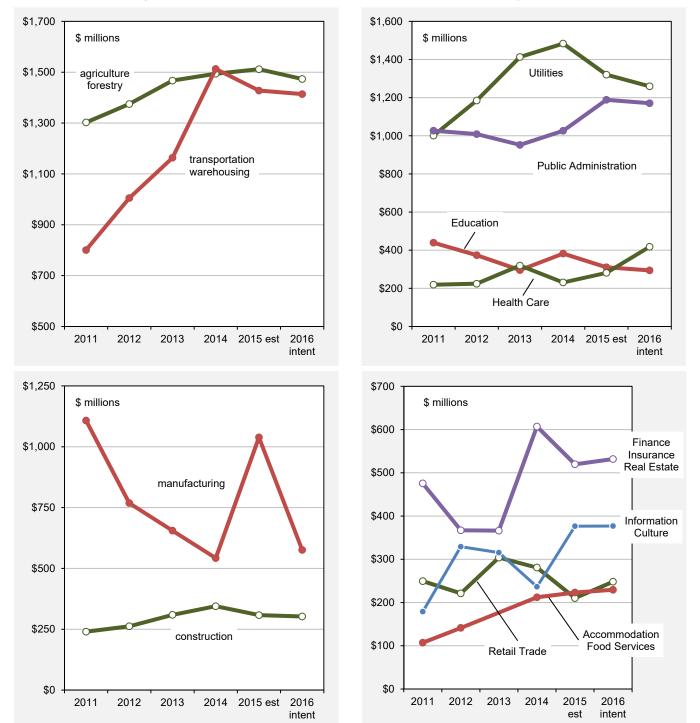

Figure 6: Actual and Intended Capital Investments, Selected Industry Groups

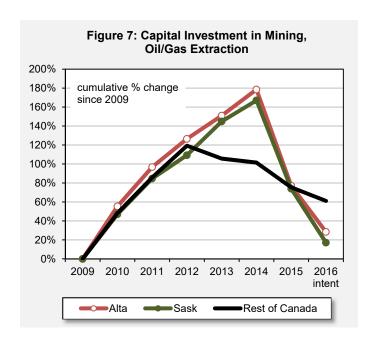

Page 5 April 2016

The comparison shown in Figure 7 shows how investment in the Alberta and Saskatchewan resource sectors track one another very closely. Capital investment almost doubled from 2009 to 2014, increasing by 179% in Alberta and 167% in Saskatchewan. The two-year decline from 2014 to 2016 was 54% in Alberta and 56% in Saskatchewan. In both provinces, investment levels this year will effectively be back to 2009 levels. Resource sector investment in other parts of Canada (which tends to be in mining rather than oil/gas) tracked Alberta and Saskatchewan from 2009 to 2012 but the decline started earlier and has not been as pronounced.

Summary

The two-year decline of 32% in new capital investment will clearly have a dampening effect on economic growth in the short term. On the other hand, capital investment is still relatively high compared with the early 2000s and the decline is almost exclusively in the resource sector.

ECONOMIC GROWTH BY INDUSTRY GROUP

P reliminary estimates for economic growth in 2015 have been released by Statistics Canada. These figures measure the Gross Domestic Product (GDP) at market prices in chained 2007 dollars. This "real GDP" measures the value of goods and services produced in an economy after removing the effects of inflation. There are measurement and interpretation issues with the GDP but most economists still use this statistic as the best overall indicator of an economy's performance.

After five years of increases, some substantial, the province's real GDP fell by an estimated 1.4% in 2015. A decline in real GDP is the definition of a recession so Saskatchewan's economy has been in a recession for three of the last ten years. The province was one of three showing a recession in 2015; the declines in Alberta and Newfoundland were larger.

The surprise in these statistics is not the decline but rather the industries which contracted. Real GDP measures the volume of output and output from the resource sector did not decline in 2015. Instead, the decline was the result of a sharp drop in construction, that is, in the construction of new mines, oil wells, houses, or stores. There were also declines in manufacturing and some industries affected by consumer spending, namely accommodation and food services and retail trade. Transportation, the finance

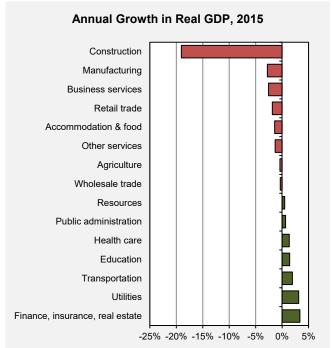

group, and the public sector industries all grew in 2015.

There have been layoffs announced in the mining sector and construction is still slow this year so GDP may very well decline again in 2016. A lot will depend on the size of the grain crop.

Page 7 April 2016

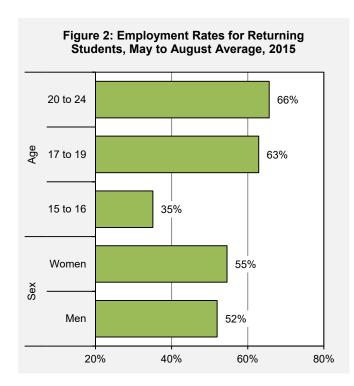

SUMMER JOBS

O ver the last decade, the number of students who were working over the summer has been on a downward trend. With the weak labour market in 2016, students can expect difficulty finding work this summer as well.

The monthly Labour Force Survey tracks the labour market activity of the 65,000 Saskatchewan students who are i) 15 to 24 years of age, ii) attended school full-time in March and iii) intended to return to school in the Fall. Figure 1 shows that, on average, 53% of these were working over the four summer months last year. With the exception of a spike in 2013, there is a clear downward trend in the employment rates for these returning students.

The unemployment rate among returning students averaged 11% over the four months. This suggests that many were looking for summer work but were unable to find it. That leaves about 25,000 who were out of the labour force, that is, neither working nor looking for work.

Figure 2 shows that the employment rates are much lower for those 15 to 16 years of age. Apparently, high school students are less likely to be working than those attending a post-secondary institution. They also have higher unemployment rates indicating that they too were looking for a summer job and were unable to find one.

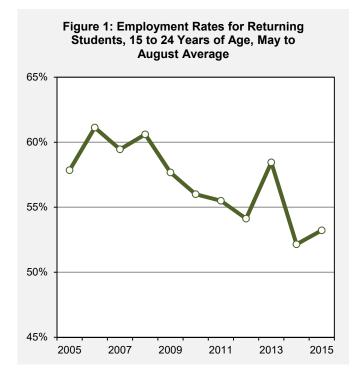

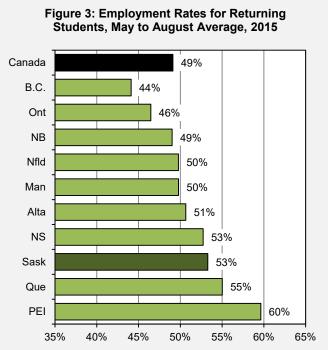

Figure 3 shows that in spite of the poor prospects for summer work among Saskatchewan students, the situation in other provinces is worse. The employment rate of 53% in 2015 was third highest among the provinces and above the national average of 49%.

HIGHLIGHTS OF CURRENT SASKATCHEWAN STATISTICS

Cultural and Sports Activity	Statistics Canada calculates the economic activity associated with culture and sports activity in a recent report. Cultural activity includes publishing, sound recording, the visual and performing arts, movie and television productions, and live performances. They estimated the cultural sector directly contributes \$1.4 billion to the provincial economy, up from \$1.2 billion in 2010 and 1.3% of all economic activity in the province. The figure shows that this is the smallest proportion in Canada. The number of people working in the cultural industries is 2.1%, which is also the lowest in Canada. The sports industry contributes 0.2%, a proportion that is near the national average. Contribution of Cultural Industries to the Provincial Economy, 2014 Canada Ont Que B.C. Man NS NB PEI Alta Nfld Sask 0% 1% 2% 3% 4%							
Employment	On a year-over-year basis, employment declined by 1.7% in April, the largest decline since 2005. Most of the decline is in full-time employment. There are double-digit declines in several industry groups including transportation, business support, and education. These were offset by increases in wholesale/retail trade, professional and technical services, and the information/culture/recreation group.							
Retail sales	Retail sales ended 2015 down 2.9% from the previous year ago. Sales started early 2016 slowly with a 0.6% decline for the first two months of the year compared with the same period in 2015. The largest drop is in service stations (-14%) but there were also declines among new motor vehicle dealers and among grocery and liquor stores.							
Consumer price inflation	The rate of inflation in the first quarter was 1.6%, the same as the 2015 average. A 4.2% increase in grocery prices was offset by smaller increases in other categories, transportation in particular (1.2%).							
International trade	The value of exports in the first quarter of 2016 was 23% lower than in the first quarter of 2015. Imports fell by 16% so both total trade and net trade declined as well.							
Job Vacancies	In the three months ending in January 2016, the number of private sector job vacancies was 5,000. This is down 42% from a year ago and the fewest since the survey was started in 2011. The number of unemployed persons in January was 36,600.							
Construction costs	There has been an inexplicable increase in average construction wage rates in the first quarter of 2016 so the cost of construction has apparently not fallen as much as expected. In March of 2016, the labour component of the capital construction cost index is up 6.0% and the material component is down 0.8%. This suggests the cost of construction is 2.8% higher than it was a year ago.							
Construction activity	The value of building permits issued in the first quarter of 2016 is 42% lower than in the first quarter of 2015. The decline is evident in both residential (-32%), institutional (-34%), and commercial/industrial projects (-57%).							
Winter vacations	The unseasonably warm winter may have contributed to the decline in winter vacations as much as the economic slowdown. In February, the number of Canadians returning from a trip abroad was down 13% from February 2015. In particular, persons returning from the USA was 18% lower.							
Grain prices	As the 2016 crop goes in, there is evidence that grain prices have bottomed out. April prices are, compared with a year ago up 10% for canola, 16% for peas, 16% for wheat, and 81% for lentils.
